(Nordmann) and *Soc. ciopoera luciopocra* (L.), caught in the delta of the Volga and Don, were investigated. The development of the golden shiner, vobla and roach are very similar, the carp is characterized by spawning in portions and shedding the eggs at higher temperature in thoroughly warm, shallow water. All these species are characterized by 9 stages of approximately equal duration. In the pike perch stage A is divided into A_1 and A_2 , there are altogether 10 stages and, even though some of these stages may be compared with the corresponding stages in the carp, the general course of development deviates considerably. In the Volga,

the bottom constitutes the principal spawning ground and brooding place where the young keep themselves. In the Don spawning and breeding takes place in the flood-lands at the mouth of its tributaries. At early stages ecological differences are not apparent except for the fact that in the Don these stages are somewhat longer than in the Volga. However, the characteristics of the flood determine the lot of the young. In the Volga delta, if a sharp or early recession occurs or if development is retarded, the young remain at the bottom until the exit becomes barred. In the flood-lands of the Don the water-meadows remain dry if there is little water, and if there is

TITLE: Wire heads for ferrography

SOURCE: Vsesoyuznaya nauchno-tekhnicheskaya sessiya posvyashchennaya Dnyu radio. 22d, 1966. Sektsiya radioveshchaniya, elektroakustiki i zvukozapisii. Doklady. Moscow, 1966, 28-31

TOPIC TAGS: electrostatic printer, reading machine, magnetic recording, character reading equipment, METALLOGRAPHIC EXAMINATION

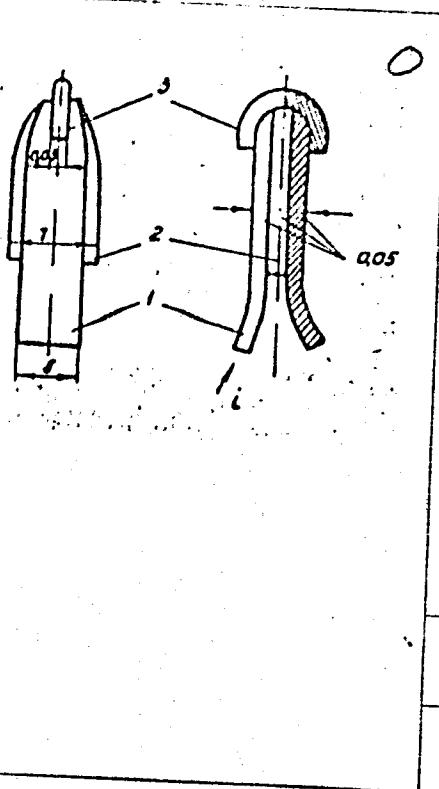

ABSTRACT: The author discusses the development of ferrographic and electrostatic methods for image recording. An experimental ferrographic recorder developed by MEIS in cooperation with GNIP-61 has an operating speed of 7000 symbols per second. The magnetic recording heads in each unit are packed at a density of 2 heads per millimeter. To increase reliability and improve the half-tone characteristics of ferrographic recording requires higher head packing density. However, studies have shown that interaction between adjacent heads and complications in manufacturing are increased while efficiency is reduced at the maximum density of 3.5 heads per millimeter using conventional toroidal design. Since this is still a rather low packing density, a new head design is needed. The application of wire heads to ferrographic recording was studied at the magnetic recording laboratory of MEIS. It was found that

Card 1/2

L 04515.67

ACC NR: AT6022350

the design shown in the figure may be packed to a density of 10 heads per millimeter without any noticeable interaction between adjacent elements. The two foil strips¹ are separated by a thin mica insulator² and connected at the tip by wire bridge³. This type of recording head has a scattering field only at the tip since the foil strips have a width much greater than their thickness and the distance between them and the current in adjacent strips flows in opposite directions which nearly eliminates the magnetic field. This book is intended for engineers, technicians and students engaged in the metallurgy of heavy and nonferrous metals, and may be used by students of higher educational schools, who are specializing in the metallurgical science of these metals. It contains 16 articles which give general information on investigations and uses of rare earths as alloying components in steels and alloys. The influence of rare earths additives in improving the technical properties of structural, fire-resistant and other steels and alloys is described. References, tables and references (mostly Soviet) accompany each article. No personalities are mentioned.

Progress in Space Research

"So Begins the Assault on Space," by A. Yeremin and V. Smirnov; Moscow, Meditairnskiy Rabotnik, No 89, (1837), 7 Nov 59., p4

This brief item asserts that the launching of the first artificial earth satellite by the USSR inaugurated a new era in man's conquest of space. Soon, says the article, earth-bound man will be able to travel to other planets. Before this dream can become a reality, it is pointed out, scientists must solve the problem of re-entry.

Soviet scientists have been conducting experiments on animals under laboratory conditions and have launched rockets containing animals. The spectacular launching of the second Soviet artificial earth satellite with a dog, Layka, is now well known.

Soviet scientists are developing special altitude equipment for high-altitude emergency conditions and are conducting laboratory tests under simulated conditions. All vital functions of the human organism are being investigated, and research on methods of training humans for life and activity under unusual conditions is in progress.

TITLE: Orientation in unsupported space

SOURCE: Aviatsiya i kosmonavtika, no. 11, 1965, 36-38

TOPIC TAGS: weightlessness, cosmonaut training, space flight simulation

ABSTRACT: In response to letters from readers requesting more details on an article published earlier, the authors present details on the moments of inertia of separate parts of the human body in various positions in unsupported space. A description is given of experiments performed to gain more information on the motor activity of man subjected to a longer (average 30 sec) period of weightlessness, created by an aircraft flying in a Kepler parabola. These experiments confirmed earlier theoretical and experimental data on the different methods of orientation (turning) of man by internal forces around three mutually perpendicular axes of the body. Some of the procedures used by the subject for turning in different.

ACC NR: AP6000255

directions are described. A study was also made on the most effective way of using support (pushing with the hands or pulling) for aimed displacement in a prescribed direction. Pulling proved to be the simplest, most convenient, and most accurate method of displacement, with minimal twisting of the body. Some other considerations which should be taken into account in selecting the scheme and the design of individual means of movement in weightlessness are discussed. Orig. art. has: 1 figure.

Korroziya i zashchita stali [Corrosion and Protection of Steel]. Collection of Articles [Moscow, Metallurg, 1959. - 235 p. - 7,000 copies printed.]

Re.: S.D. Tuznabov, Doctor of Chemical Sciences, Professor; Reviewer;
A.A. Zakhovaritsa, Doctor of Chemical Sciences, Professor; and
E.S. Ponomarenko, Doctor; Ed. of Publishing House: V.G. Alverdov, Tech.
Ed.; S.M. Popova, Managing Ed., for Literature on Machine and Instrument
Construction. M.V. Polozov, Engineer.

REFRECH: This book is intended for scientific and technical personnel concerned with questions of the corrosion and protection of metals.

CONTENTS: The articles in this collection deal with the corrosion of steels in corrosive environments, investigation of the effect of various factors on corrosion, and methods of protection of steels from gas and electrochemical corrosion. Special attention is given to new methods of investigation. A number of the articles give the results of studies made under operating conditions. New data, obtained by the Department of Metal Corrosion.

In Moscow, Soviet staff [Doctor's Institute of Steel], are published here for the first time. Four articles are the result of work conducted jointly at the laboratories of the Molotovsk Metallurgical Plant (Serp i sol'yu) (Novosibirsk Metallurgical Plant Serp i sol'yu) and the Dnibrochelyard Naval M.R. Malinina (Chemical Plant Izmail N.P. Malinina). Most of the articles contain practical recommendations on the protection of steels from corrosion. No periodicals are mentioned. References follow each article.

Metallurg. Inst. R. D. Tsvetkov, A. V. Novikov, Head of Dept. of Chemistry,

and P. V. Radchenko, Candidate of Chemistry.

NOTES: This collection of articles is intended for scientific workers at

research institutes and technical personnel of plant laboratories.

CONTENTS: The articles included in this collection deal basically with methods of

corrosion investigation which have not yet been published in Soviet periodicals.

Literature has an array of difficulties interest for studying corrosion processes.

A wide range of problems is covered. In addition to the methods discussed,

the articles provide some experimental data which make possible full utilization of each individual method. No personalities are mentioned. References

accompany each article.

TITLE: Dependence of the chemical durability and crystallization capacity of
glass on composition and manufacturing method

SOURCE: Atomnaya energiya, v. 15, no. 2, 1963, 130-138

TOPIC TAGS: fission product, fission-waste disposal, radioactive-isotope dis-
posal, radioactive waste disposal, glass, chemical durability, glass-melting
temperature, silicon dioxide content, sodium oxide content, flux, boron trioxide,
Beta radiation, glass crystallization, glass annealing, optimum glass composition,
radioactive-isotope-containing glass, heavy-metal-containing glass, silicon
dioxide, sodium oxide

ABSTRACT: In an attempt to facilitate radioactive-waste disposal a study was made
to find chemically durable glasses from hydroxides of radioactive isotopes from
spent liquids of the atomic energy industry. The chemical durability must be
accompanied by a relatively low glass-melting temperature and heat and radiation
resistance, especially if a high heavy-metal content is expected. For this

Card 1/43 12

L 17893-63

ACCESSION NR: AP3005221

purpose a powdered model composition (powder) consisting of Fe(OH)_3 , $\text{Na}_2\text{U}_2\text{O}_7$, and $\text{Ca}(\text{OH})_2$, with a ratio of $\text{Fe}_2\text{O}_3/\text{Na}_2\text{U}_2\text{O}_7/\text{CaO} = 1/2/1$, was used in certain ratios with glass-forming additives, such as sand and soda, for preparation of a series of specimens, the durability of which was tested by the powder method in neutral (H_2O), acid (0.1 N HCl), and alkaline (0.1 N NaOH) media. The temperature of the medium was 90°C, and the testing time, 2 hr. The optimum melting temperature, time, and powder-to-additive ratio depend on the ability of heavy-metal oxides to form glass with the additives. This ability depends on the viscosity of the melt, which in turn depends on the SiO_2 and Na_2O content. It was found that a powder-to-additive ratio of 1.85, a melting temperature of 1200°C, and melting time of 2 hr were necessary to produce a glass satisfactorily binding heavy metals and, consequently, with good durability. The contents of SiO_2 and Na_2O in such a glass were 50% and 15%, which was considered an optimum composition. Dropping the melting temperature to 1100°C required a longer melting time — up to 6 hr — in order to improve the chemical durability of these glasses. Further experiments were conducted in order to decrease the melting temperature by replacing SiO_2 with fluxes such as B_2O_3 (as boric acid). A decrease of 150°C in melting temperature was achieved. Attempts to enhance the chemical durability of the glass by introducing Al_2O_3 failed. Thus, the optimum conditions for

Card 2/4 3

L 17893-63

ACCESSION NR: AP3005221

manufacturing the required glass could be summarized as follows: melting temperature, 1050°C; melting time, 3–6 hr; ratio of powder to additive, 1.85; and composition of the additive, 77% SiO_2 , 15.4% Na_2O , and 7.6% B_2O_3 . The resulting glass contained 50% SiO_2 , 10% Na_2O , and 5% B_2O_3 . The chemical durability of this glass was compared, through testing with the previously mentioned media, with the durability of glass used for manufacturing chemical-resistant laboratory glassware. The glass obtained was comparable in the neutral, better in the alkaline, and more soluble in the acid medium, which can be explained by the presence of heavy-metal oxides. Study of the effect of annealing temperatures (350–900°C) and β -radiation indicated that varying the SiO_2 content cannot prevent crystallization, which is enhanced by β -radiation. Radiation alone, however, caused no crystallization. The composition of the crystallized phase was found by x-ray diffraction to be $\text{Na}_2\text{O} \cdot 2\text{CaO} \cdot 5\text{SiO}_2$. The chemical durability of the crystallized glass is lower in the acid medium than that of the original glass. Irradiation decreases this durability still more because of increased crystallization. Orig. art. has: 10 figures and 6 tables.

TITLE: Transistorized switching circuits

PERIODICAL: Pribory i tekhnika eksperimenta, March-April 1963, v. 8, no. 2,
90-92

TEXT: This article partially satisfies the need for publication of detailed data on Soviet transistors operating with small voltages and currents and gives experimental characteristics for transistors in a switching circuit. The dynamic range of the switch is at least 500. The switch transient is no more than 1.5 msec and the delay is 5 msec. A circuit for switch control is given. There are seven figures.

TOPIC TAGS: amplifier, pulse amplifier, transistorized pulse amplifier, parallel feedback transistorized amplifier, precision transistorized amplifier

ABSTRACT: Transistorized amplifier units intended for experimental physics purposes are briefly described; their gain is from 1 to 20; leading-edge pulse time, 0.1 microsec or shorter; amplitude-characteristic nonlinearity, 0.2% or less. The effect of temperature on a P401 transistor gain is presented, simplified circuit diagrams of 3- and 4-transistor units are shown, and hints as to the most suitable application of current-feedback and voltage-feedback amplifiers are supplied. SOURCE: Radiotekhnika i elektronika, v. 9, no. 5, 1964, 780-783

TOPIC TAGS: amplifier, electronic amplifier, negative feedback amplifier, parallel feedback amplifier, nuclear spectrometry, nuclear counter

ABSTRACT: Formulas are developed for thermal noise, grid-current (conductance) noise, shot noise, and flicker noise occurring in a parallel negative-feedback amplifier intended for current-pulse-type input. The noise due to the input circuit, feedback, and the first tube is considered separately from the noise due to other stages. All formulas valid for the amplifier with the first tube of anode-output type can be extended over the case of the first tube of cathode-output type. Orig. art. has: 1 figure and 17 formulas.

TITLE: Measuring integrating amplifier ✓

SOURCE: Izmeritel'naya tekhnika, no. 3, 1966, 53-55

TOPIC TAGS: electronic amplifier, transistorized amplifier, measuring amplifier, integrating amplifier

ABSTRACT: Well-known design formulas for a transistorized integrating amplifier are written. The integrator scale factor $\gamma = 1/R_1 C_{osc} \cdot c_{out}/S_{in}$. A 4-transistor capacitor-stabilized amplifier circuit having an estimated $\gamma = 956$ per sec and a time constant $T = 0.1$ sec was experimentally investigated. Exponential skirt pulses were applied to the amplifier, and the square output

pulses were measured by an oscilloscope acting as a balance detector. The measured value was $\delta = 949$ per sec. Experimental γ/γ_0 characteristics, where γ_0 is a certain value of γ for constant T_1 and T_2 , exhibit high linearity of the amplifier. Transistor replacements had very little effect on φ_{out} . The emitter-follower 4-transistor amplifier has the advantage of a very short transient time: 1/6 to 1/5 that of a 3-transistor amplifier. Orig. art. has: 3 figures, 12 formulas, and 1 table.
